DOOR HARDWARE			
DR - 003	Dutch Door		1
P-H - HASP	Hasp		1
P-H - DHAND	Door handles		1
P-H - THING6	Door hinges		4
P-H - BBLT4	Barrel bolt		1
Instruction manual, questionnaire and driver bit			

* door trim-narrow to be used when door is located on 8 ft side/
wide to be used when door is located on 4 ft side.

FOUNDATION PREPARATION

PREPARE THE SITE:

Before you begin assembly, clear the construction area. Remove all organic material such as roots grass, dirt and large rocks that may compromise the ability to level the site. Make sure the ground slopes away from the site at least 10 ft. (3.05 m.) in all directions. If necessary, build up the centre of the site and slope away from the high point to provide drainage. Fill in any low spots within the perimeter of the site. Be sure to use gravel or a good packing material to level the site. Make sure it is packed down before beginning the building process.

FIUNDATION CHOICES:

1. Concrete Patio Stones (not included)

If the ground is stable and has sufficient drainage, you can set patio stones directly on a firm compacted gravel base. Make sure the stones are thick enough to allow air circulation under the structure. This helps to prevent dry rot from setting in on the joist. The bearing points are outlined in the next page of this manual.

2. PRESSURE TREATED WOOD STRINGERS (not included)

A second option is to use 4x4 (90 mm x 90 mm) stringers which can run the full width of the structure. Be sure to use a stringer every 4 ft. For example for an 8x12 floor structure, you will need 4-8 ft. stringers. This reduces the amount of leveling needed as you only need to level each end of the stringer. However, it will increase the height of the shed and you may require a ramp or an additional step at the doorways.

3. CONCRETE SLAB

Typically a slab 3"-4" (75 - 102 mm) thick laid over a subbase of 4" (102 mm) of gravel or crushed rock is sufficient but may vary (consult your local Home Centre). Either mix your own concrete or have it delivered to your site. A 10' x 10' x 4" (3.05 m. x 3.05 m. x 10.2 cm.) slab will require approximately 1 cubic yard (0.764 cubic metre) of concrete. In any case, make sure you excavate the slab area to a depth of 6" (15.2 cm.), use 4" (10.2 cm.) of gravel as your subbase. Welded wire mesh as reinforcing (optional) and 4" (10.2 cm.) of concrete (trowel to allow for drainage away from the centre high point). Still use 1" (2.54 cm.) thick patio stones on the concrete slab to allow adequate air circulation to keep the floor joist dry. This will prevent dry rot from setting in.

4. POURING CONCRETE PIER POINTS USING SAUNA TUBES

Another option would be the pouring of concrete pier points using sauna tubes. Using the next page as a guide, place sauna tubes into the ground at each of the bearing points. Make sure the tops of the sauna tubes are level with the other. You may also wish to inbed metal straps into the concrete. These straps will be nailed to the joist structure.

1. Foundation Preparation

6x9 OSB Ply

FOUNDATION PREPARATION

1. Use a 2x3 or 2x4 straight piece of lumber on edge and a carpenter's level to level the perimeter patio stones. Add or remove soil under each stone until it is flush with the bottom of the 2x4 as shown in Fig. 1. Continue this procedure with the stones until you are satisfied all the stones are level with one another.

46 1/2" x 46 1/2" Joist Box - P9

Revised 12/22/10

JOIST BOX ASSEMBLY

Lay the joist parts out as per Fig. P9-1. Using 2- 3" screws per joint, assemble the joist box together as per Fig P9-2. The completed joist box is pictured in Fig. P9-3.

46 1/2" x 46 1/2" joist box layout

FLOOR ASSEMBLY

B124

Attach P-11, P-9, and P-12 joist boxes together using 6-3" screws. Please refer to Fig F-1 and Fig F-2 for details.

Affix the plywood panels as per Fig. F-3 using 2" screws on 12" and affixing the plywood to each row of joist. The finished floor is shown in Fig F-4.
