Guide to Dimensions

VALANCE - It's the fabric that extends from either end of the retractable slide wire canopy. Most times it is 1.5" and will have grommets for fastening to hold in place. It can be longer to provide additional shade from a rising or setting sun when near the horizon.

TOTAL LENGTH - Is the length of the finished shade when stretched out flat. In most cases it will be longer than the Coverage Length due to the extra fabric length between rods/battens that hangs down between them. The more it hangs down, between the battens, to create the scallop look desired, more fabric will be needed. The length of the Front and Rear valance will also add to the Total Length.

COVERAGE LENGTH - the maximum length of the shade panel when it is deployed fully deployed to provide shade where intended.

BATTENS - Is usually a rod or pipe that is inserted into a rod pocket sewn into the shade panel at equal intervals. Most common battens are PVC or Electrical Conduit Pipes, usually 1/2" or 3/4" pipe. We can accommodate any rod if we know its Outside Diameter (OD) or the LxW of a square or rectangle.

WIRE WIDTH - Is the distance between the outer two wires and is needed in some of the styles.
